

## Power Management Units (PIU/PMU)

The Power Management Unit (**PMU**) is a high availability power source designed to enable valuable telecom equipments to work with maximum reliability and availability in harsh AC mains environment.

This is ideal for powering critical applications such as **BTS** sites of **GSM, CDMA, 3G & 4G** networks as well as optical repeater networks.

This is integrated in a single cabinet comprising all the **Power & Generator** management and complete monitoring functions as required for telecom sites. **PMU** reduces floor and wall space in the telecom site due to its high level integration. **PMU** eliminates the complex interconnection wiring found in conventional telecom site power solutions thus making the **PMU** easy to deploy and maintain.
